Otto Künnecke Systems

We will be feeding one CR80 card, which has been preperforated into 5 mini cards. Each mini card is then personalised using MEK before verifying data and passing through the hot stamp applicator. Due to its piston design, hot foil labels can run at speeds of up to 250,000 mini cards per hour.

Hot foil fuses itself to the card, making it much more secure than a standard label as it is impossible to tamper with the label. This is a much sought after feature and interest is ever increasing. Please let us know as soon as possible if you plan on attending to see this product run.

A second configuration will be set up for a more popular job, encoding CR80 cards, while personalising and affixing scratch off labels. With multi stage verification, it will automatically remake bad cards, and with options to either separate or remake the batch, cards in an incorrect order will be a thing of the past. About time!
